

ABSTRACT OF THE DISCLOSURE

A broadcast system, method and apparatus providing content on demand.

In one embodiment, the disclosed broadcast system includes a server that broadcasts meta-data to a plurality of clients. The meta-data describes a plurality

5 of data files that are to be broadcast or potentially broadcast later by the server.

Each client receives the broadcasted meta-data from the server and updates and maintains a local meta-data table and a content rating table. Based on the meta-data, previous access habits of the user and optional user classifications, the client system selectively receives and/or stores the data files that are later broadcast by

10 the server. In one embodiment, the client systems transmit back to the server ratings of each one of the data files described by the meta-data based on the user's previously accessed data files and optional user classifications. The server then determines the data files to be broadcast and the broadcast schedule based on the ratings received from the clients.
